

SecureStream Sentry Network

A secure managed alternative to a MPLS Network with zero hardware cost

When you need to build a secure network for your business there is now a much better way to do it.

You can forget the weeks or months needed to build and implement an M.P.L.S. network and you can also forget the headaches of implementing and then supporting your own router-based VPN network, nevermind the costs associated with either of these methods.

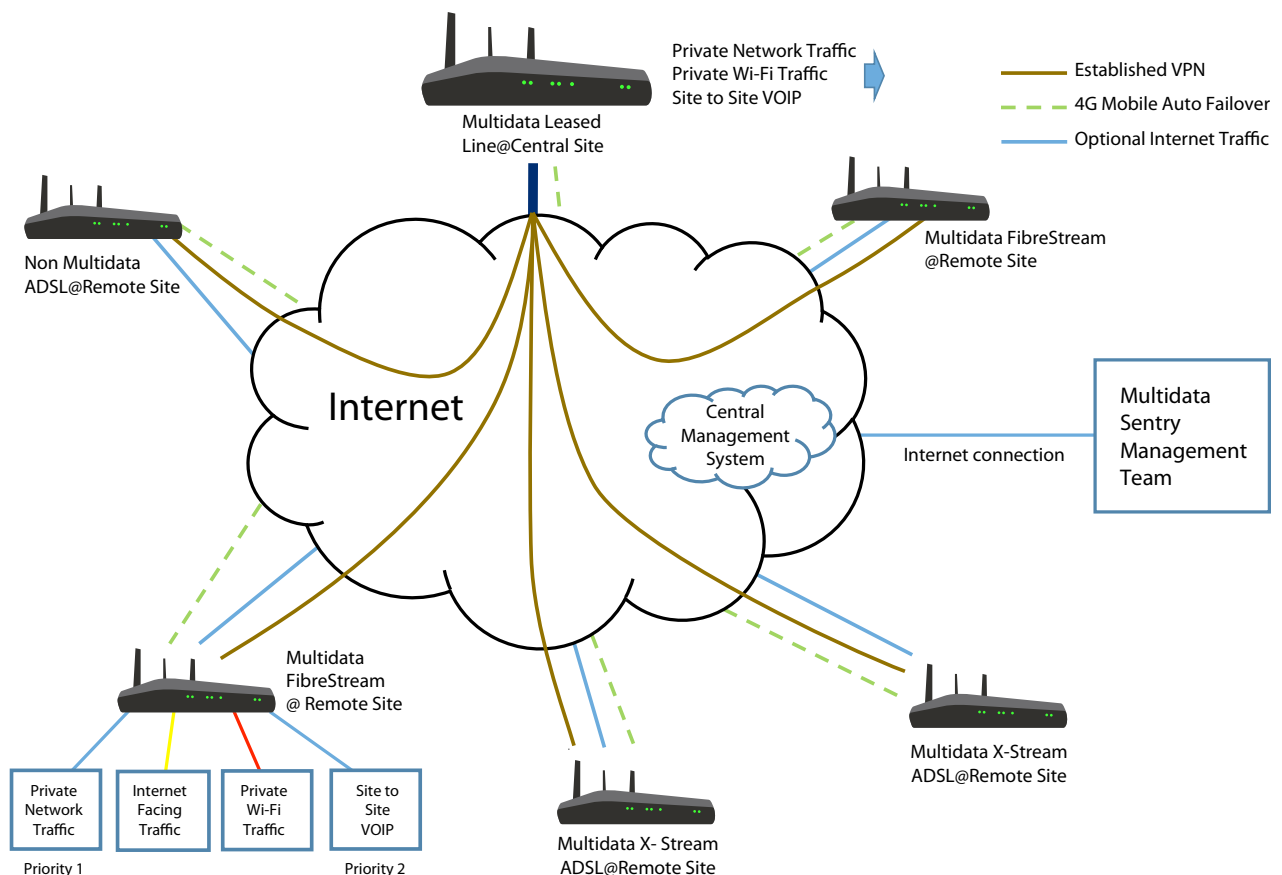

Now all you need is a Multidata SecureStream Sentry and a standard broadband, fibre broadband or leased line, plus a low cost monthly subscription to our SecureStream Sentry service.

By installing a Sentry Concentrator at your central site and one or more standard Sentries at your remote sites, Multidata can provide you with secure site-to-site and site-to-central-site connections that are managed and monitored 24/7, 365 days a year. Once you have told us how you want your network configured, we will set everything up in just a few days and ship out the required units to the various locations.

Key Features

- Quick to deploy - days not weeks or months
- All the functionality of an MPLS, with zero hardware cost
- Works with any type of Internet Connection
- WAN failover automatic to high speed 4G
- Moves, changes and additions all carried out for you quickly and for free
- Re-deploy units anywhere if required
- QOS for sensitive applications
- Optional public internet connections with Firewall and Content filtering built in
- Lan segmentation
- Local Wi-fi and Enterprise Wi-Fi (central site authentication)
- PCI DSS level 1 certified
- Traffic prioritisation/management/thresholding
- Full usage reporting
- Automatic security and software updates across the network
- Establish dynamic VPN when required

More about SecureStream Sentry

All you do is plug the units in, then sit back and relax while our Sentry team monitor and manage everything for you.

Want comprehensive usage reports? No problem. Want to change some traffic priorities? Want to establish a dynamic vpn between two sites just for a couple of days? No problem. Our SecureStream Sentry management team will do all this for you at no additional cost.

Your Sentry device and the associated service is very intelligent and performs not only secure networking but broadband routing, bandwidth management, traffic management and secure enterprise wi-fi as well. Best of all thanks to built-in 4G high speed mobile data back-up SecureStream Sentry is a totally NON STOP service too. You need do nothing in the event of a WAN failure. The SS team will already be trouble shooting your connection (assuming it's with us) but in the meantime, service connectivity is maintained via 4G until normal service is resumed. In other words your private network never goes down!

As an added bonus, if you need to comply with Payment Card Industry standards, you will be pleased to know that Sentry is also PCI DSS level 1 certified.

Of course, we would love to supply our top quality business broadband (fibre and copper) for the site-to-site connections as well as perhaps a high capacity fibre leased line at the central site, but Sentry can even use leased lines or broadband connections you already have in place. This makes implementation even quicker and allows you to move connections over to us for 100% management whenever you choose.

The Multidata SecureStream Sentry even lets you build ordinary internet facing connections as well, which can sit alongside the secure ones. These optional connections come with firewall capabilities and industry standard content management filtering. All of this from the same device, all for a low monthly fee and all configured and delivered in just a few days.
